

# Assignment stations (dosiSTATION)

Assignment stations are equipped with local storage for measurement data from returned dosimeters. This ensures the security of the measurement data even in the event of a network interruption between the station, server and database. As soon as the network connection is restored, the data is automatically transmitted through regular synchronisation between the system modules.

The assignment station is available in four versions: nanoSTA, microSTA, miniSTA, and miniSTA with EXT, offering the following features:

nanoSTA

- Assignment of a dosimeter (APD) to a person
- Sign-off after use and automatic transfer of measurement data to the database
- Access to personal dose data
- Storage and charging function
- Touchscreen for operating the station
- Slots for 1, 4, 8, or 16 dosimeters
- Network connection via RJ-45 or Wi-Fi

microSTA

miniSTA
